

TOROIDAL CORES: FERRITE CORES

Ferrite Cores are available in numerous sizes and several permeabilities. Their permeability range is from 20 to more than 15,000. They are very useful for resonant circuit applications as well as wideband transformers and they are also commonly used for RFI attenuation. We can supply sizes from 0.23 inches to 2.4 inches in outer diameter directly from stock.

Ferrite toroidal cores are well suited for a variety of RF circuit applications and their relatively high permeability factors make them especially useful for high inductance values with a minimum number of turns, resulting in smaller component size.

There are two basic ferrite material groups: (1) Those having a permeability range from 20 to 800 μ are of the Nickel Zinc class, and (2) those having permeabilities above 800 μ are usually of the Manganese Zinc class.

The Nickel Zinc ferrite cores exhibit high volume resistivity, moderate temperature stability and high 'Q' factors for the 500 KHZ to 100 MHz frequency range. They are well suited for low power, high inductance resonant circuits. Their low permeability factors make them useful for wide band transformer applications as well.

The Manganese Zinc ferrites, having permeabilities above 800 μ , have fairly low volume resistivity and moderate saturation flux density. They can offer high 'Q' factors for the 1 KHz to 1 MHz frequency range. Cores from this group of materials are widely used for switched mode power conversion transformers operating in the 20 KHz to 100 KHz frequency range. These cores are also very useful for the attenuation of unwanted RF noise signals in the frequency range of 20 MHZ to 400 MHZ and above.

A list of Ferrite toroids, including physical dimensions, A_L values, and magnetic properties will be found on the next few pages. Use the given A_L . value and the equation below to calculate a turn count for a specific inductance.

$$N = 1000 \sqrt{\frac{\text{desired 'L' (mh)}}{A_L (\text{mh}/1000 \text{ turns})}}$$

N = number of turns L = inductance (mh) A_L = inductance index (mh)/1000 turns

$$L(\text{mh}) = \frac{A_L \times N^2}{1,000,000}$$

$$A_L(\text{mh}/1000 \text{ turns}) = \frac{1,000,000 \times 'L' (\text{mh})}{N^2}$$

To improve voltage breakdown, coatings of ferrite cores are available for the F, J, W and H materials. Typical coatings are parylene C, Gray Coating and Black Lacquer. Parylene C coating has a thickness of 0.5 mils to 2 mils with a voltage breakdown of 760V. Gray coating has a thickness of 4 mils to 8 mils with voltage breakdown of 500V. Black Lacquer coating has a thickness of 0.5 mils to 2 mils with no increase in voltage breakdown.

All items in this website are standard stock items and usually can be shipped immediately. Call for availability of non-stock items.

For standard stocking items of Inductors, Chokes, Transformers and other wound ferrites, please see Multilayer Chip Beads.

For custom design of Inductors, Chokes, Transformers or Special Coil Windings, please call or fax your specifications today.

Amidon provides engineering designs, prototyping and manufacturing. Low to high volume production capability with the most competitive pricing.

MATERIAL 33 (μ = 850) A manganese-zinc material having low volume resistivity. Used for low frequency antennas in the 1 KHZ to 1 MHZ frequency range. Available in rod form only.

MATERIAL 43 ($\mu = 850$) High volume resistivity. For medium frequency inductors and wideband transformers up to 50 MHz. Optimum frequency attenuation from 40 MHZ to 400 MHz. Available in toroidal cores, shield beads, multi-aperture cores and special shapes for RFI suppression.

MATERIAL 61 ($\mu = 125$) Offers moderate temperature stability and high 'Q' for frequencies 0.2 MHz to 15. MHz . Useful for wide band transformers to 200 MHz and frequency attenuation above 200 MHz. Available in toroids, rods, bobbins and multi-aperture cores.

MATERIAL 67 ($\mu = 40$) Similar to the 63 material. Has greater saturation flux density and very good temperature stability. For high 'Q' inductors, (10 MHz to 80 Mhz). Wideband transformers to 200 MHz. Toroids only.

MATERIAL 68 ($\mu = 20$) High volume resistivity and excellent temperature stability. For high Q' resonant circuits 80 MHZ to 180 MHz. For high frequency inductors. Toroids only.

* This item has been discontinued, please refer to [Material 61](#) or [Material 67](#).

MATERIAL 73 ($\mu = 2500$) Primarily a ferrite bead material. Has good attenuation properties from 1 MHZ through 50 MHz. Available in beads and some broadband multi-aperture cores.

MATERIAL 77 ($\mu = 2000$) Has high saturation flux density at high temperature. Low core loss in the 1 KHZ to 1 MHz range. For low level power conversion and wide band transformers. Extensively used for frequency attenuation from 0.5 MHZ to 50 M Hz. Available in toroids, pot cores, E-cores, beads, broadband balun cores and sleeves. An upgrade of the former 72 material. The 72 material is still available in some sizes, but the 77 material should be used in all new design.

MATERIAL 'F' ($\mu = 3000$) High saturation flux density at high temperature. For power conversion transformers. Good frequency attenuation 0.5 MHZ to 50 MHz. Toroids only.

MATERIAL 'J '/75 ($\mu = 5000$) Low volume resistivity and low core loss from 1 KHZ to 1MHz. Used for pulse transformers and low level wide band transformers. Excellent frequency attenuation from 0.5 MHZ to 20 MHz. Available in toroidal form and ferrite beads as standard off the shelf in stock. Also available in pot cores, RM cores, E & U cores as custom ordered parts with lead time for delivery.

MATERIAL K ($\mu = 290$). Used primarily in transmission line transformers from 1.0 MHZ to 50 MHZ range. Available from stock in a few sizes in toroidal form only.

MATERIAL W ($\mu = 10,000$). High permeability material used for frequency attenuation from 100 KHZ to 1 MHZ in EMI/RFI filters. Also used in broadband transformers. Available in toroidal form from stock. As custom ordered parts for pot cores, EP cores, RM cores.

MATERIAL H ($\mu = 15,000$). High h permeability material used for frequency attenuation under 200 KHz. Also used in broadband transformers. Available in toroidal form only.
